

Black Anodized Machined Aluminum Housing ("Hard Bodyz" Body & Side Cover)

Daiwa BG is equipped with a machined aluminum body and body cover providing strength and internal part stability. To increase the strength in the form of corrosion and scratch resistance, Daiwa has Black Anodized the body and body cover. The anodization process allows for better adhesion to the aluminum and will not chip or peel like a painted surface, extending the brilliant look of the BG spinning series.

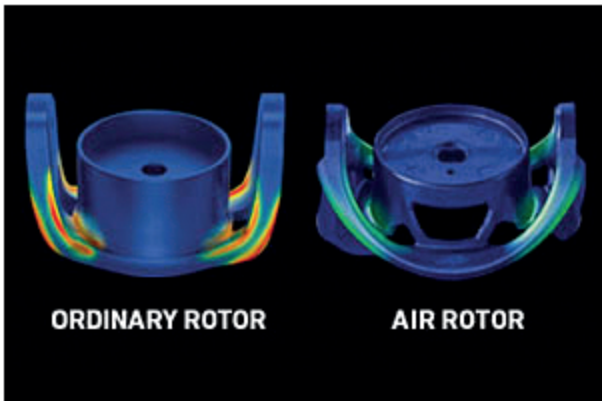

OVER-SIZED DIGIGEAR™ (DIGIGEAR™ SYSTEM)

Daiwa BG spinning series have integrated the largest drive gear in the history of Daiwa spinning reels. The benefit to having this oversized gear increases gear-tooth contact points, this provides smoother and extended gear life as well as more power and increased torque.

Solid Screw-In Handle

Daiwa's Screw-in-Handle design provides zero movement or play between the main gear and handle arm. This lack of movement offers the angler both confidence and control when rotating the handle.

AIR ROTOR

The Air Rotor weighs up to 15% less than ordinary rotor designs. Its unique shape reduces unnecessary weight while distributing stress more evenly throughout the rotor for maximum strength.

ABS SPOOL

The ABS spool's maximized core diameter and reversed taper mean 100% useable line. No "dead" line buried in a deep core. You can fill it with line right up to the edge of the spool lip without fear of tangles. ABS cause less casting friction for longer and easier casting. The huge spool diameter line flow freely in larger coils and produces less line memory coil. Smaller spool diameter means line flows in tighter coils as well.
