------------	-------------------------------	----

## 1 Introduction

Congratulations on your purchase of the Maretron GPS200 GPS Antenna/Receiver. Maretron has designed and built your GPS200 to the highest standards for years of reliable, dependable, and accurate service.

The Maretron GPS200 is designed to operate within the harsh demands of the marine environment. However, no piece of marine electronic equipment can function properly unless installed and maintained in the correct manner. Please read carefully and follow these instructions for installation and usage of the Maretron GPS200 in order to ensure optimal performance.

### 1.1 Firmware Revision

This manual corresponds to GPS200 firmware revision 1.0.1.

### 1.2 GPS200 Features

The Maretron GPS200 has the following features.

- NMEA 2000® Interface
- 32 Channel GPS Antenna/Receiver
- Up to 5Hz Position Update Rate
- Satellite Based Augmentation System (SBAS) capable (WAAS, EGNOS and MSAS)
- Accurate Location, COG and SOG Data to Any NMEA 2000® Device Including Chart Plotters, Autopilots, and Instrumentation Displays
- Magnetic Variation Output Based on World Magnetic Model
- Waterproof Enclosure and Cable System

## 2 Installation

### 2.1 Unpacking the Box

When unpacking the box containing the Maretron GPS200, you should find the following items:

- 1 - GPS200 GPS Antenna/Receiver
- 1 - Pole Mount Base
- 3 - Mounting Screws and Lock Washers
- 1 - GPS200 User's Manual
- 1 - Warranty Registration Card

If any of these items are missing or damaged, please contact Maretron.

### 2.2 Choosing a Mounting Location

The selection of a suitable mounting location is important for the optimal performance of the Maretron GPS200. The mounting location and orientation of the GPS200 should be:

1. *Level with the earth's horizontal plane* – This gives the GPS200 antenna the optimal view of satellites from all directions.
2. *High Enough to have a clear view of the sky to the horizon in all directions unblocked by masts or antennas* – The GPS200 provides the best readings when it has access to as many satellites as possible.
3. *As far as possible from VHF, satellite, or radar antennas* – Radio frequency transmissions from these antennas can interfere with the proper reception of GPS satellite signals by the GPS200.

### **2.3 Mounting the GPS200**

The Maretron GPS200 can be mounted directly on top of a horizontal surface (Section 2.3.1) or on top of a 1" 14 threads per inch standard marine pole mount (Section 2.3.2).

#### **2.3.1 Mounting the GPS200 to a Horizontal Surface**

Attach the GPS200 securely to the vessel using the included brass mounting screws and included lock washers or other fasteners as shown in Figure 1 (see mounting template in Section 8 for drill pattern). Do not use threadlocking compounds containing methacrylate ester, such as Loctite Red (271), as they will cause stress cracking of the plastic enclosure.

**Figure 1 – Mounting the GPS200 to a flat surface**

## **2.3.2 Mounting the GPS200 to a Standard Marine Pole Mount**

Screw the included GPS200 antenna mount base to the standard marine mount. Thread the NMEA 2000® cable through the standard marine mount and the antenna mount base from the bottom out through the top and connect it to the GPS200 unit (see Section 2.4 below). Finally, attach the GPS200 to the antenna mount base using the included brass mounting screws and lock washers as shown in Figure 2. Do not use threadlocking compounds containing methacrylate ester, such as Loctite Red (271), as they will cause stress cracking of the plastic enclosure.

**Figure 2 – Mounting the GPS200 to a Standard Marine Pole Mount**

## **2.4 Connecting the GPS200**

The Maretron GPS200 provides a connection to an NMEA 2000<sup>®</sup> interface through a connector that can be found on the bottom of the device (see Figure 3).

***Figure 3 – GPS200 Interface Connector***

The NMEA 2000<sup>®</sup> connector is a five pin male connector (see Figure 4). You connect the GPS200 to an NMEA 2000<sup>®</sup> network using a Maretron NMEA 2000<sup>®</sup> cable (or compatible cable) by connecting the female end of the cable to the GPS200 (note the key on the male connector and keyway on the female connector). Be sure the cable is connected securely and that the collar on the cable connector is tightened firmly. Connect the other end of the cable (male) to the NMEA 2000<sup>®</sup> network in the same manner. The GPS200 is designed such that you can plug or unplug it from an NMEA 2000<sup>®</sup> network while the power to the network is connected or disconnected. The cable should not hang on the GPS200 connector more than a few feet without some sort of strain relief. For example, you wouldn't want several feet of cable hanging straight down within a mast without strain relieving the cable. Please follow recommended practices for installing NMEA 2000<sup>®</sup> network products.

**Figure 4 – NMEA 2000® Connector Face Views**

## 2.4.1 Checking Connections

Once the NMEA 2000® connection to the Maretron GPS200 has been completed, check to see that GPS information is being properly transmitted by observing an appropriate display. Refer to Section 5, “Troubleshooting”, if no GPS information appears.

## 3 Operation

As shipped from the factory, the GPS200 automatically provides position, time, SOG, COG, magnetic variation, and satellite information and requires no user configuration. However, some of the GPS200 parameters are user configurable as described below:

- Device Instance - If you have more than one GPS on the vessel, you can configure unique instances so listening devices can distinguish one GPS from another.
- Installation Description - You can configure a couple of special text fields within the GPS200 with any text you desire. If you do configure these text fields, they will show up with certain diagnostic tools (e.g., Maretron’s N2KAnalyzer software) and are useful for things like location or when and who installed the GPS200.
- Periodic Rate of Transmission – As shipped from the factory, the GPS200 transmits PGNs at a periodic rate. Alternatively, a PGN can be disabled by programming its periodic rate to zero.
- Label - Labels are useful for identifying particular products on the network. For example you might have two GPSs, one labeled “Primary GPS” and the other labeled “Backup GPS”. When you go to build your favorite screens on Maretron’s DSM250 dedicated display or N2KView software, you can easily identify which GPS you want to use for that favorite screen.
- Satellite Based Augmentation System (SBAS) – the GPS200 may be programmed to use differential correction or SBAS (WAAS in USA, EGNOS in Europe, MSAS in the Far East), which is the factory default. You may disable the SBAS capability if desired.

These parameters may be configured using a Maretron display (DSM250), or the parameters can be configured using a Maretron NMEA 2000<sup>®</sup>/USB gateway (USB100) and Maretron's N2KAnalyzer software.

Users with direct access to the NMEA 2000<sup>®</sup> interface may configure these parameters directly through the NMEA 2000<sup>®</sup> interface. Please refer to Appendix A for a description of the NMEA 2000<sup>®</sup> messages used to configure these parameters.

### **3.1 Magnetic Variation**

Magnetic variation is the angular difference between the true meridian (great circle connecting the geographic poles) and the magnetic meridian (direction of the lines of magnetic flux). Magnetic variation has different values at different locations on the earth with most areas undergoing change to the magnetic variation over time.

The GPS200 indicates magnetic variation anywhere on Earth using the World Magnetic Model (WMM). It is important to understand that the WMM geomagnetic model only characterizes that portion of the Earth's magnetic field that is generated in the Earth's fluid outer core (the main magnetic field). The portions of the geomagnetic field generated by the Earth's crust and upper mantle, and by the ionosphere and magnetosphere, are not represented in the WMM. Consequently, a magnetic sensor such as a compass or magnetometer may observe spatial and temporal magnetic anomalies when referenced to the WMM. In particular, certain local, regional, and temporal magnetic declination anomalies can exceed 10 degrees. Anomalies of this magnitude are not common but they do exist. Declination anomalies of the order of 3 or 4 degrees are not uncommon but are of small spatial extent and are relatively isolated.

On land, spatial anomalies are produced by mountain ranges, ore deposits, ground struck by lightning, geological faults, and cultural features such as trains, planes, tanks, railroad tracks, power lines, etc. The corresponding deviations are usually smaller at sea, and decrease with increasing altitude of an aircraft or spacecraft. In ocean areas, these anomalies occur most frequently along continental margins, near seamounts, and near ocean ridges, trenches, and fault zones, particularly those of volcanic origin. Ships and submarines are also sources of magnetic anomalies in the ocean.

However, from a global main field perspective, the declination (D), inclination (I), and grid variation (GV) RMS errors of WMM are estimated to be less than 1.0° at the Earth's surface over the entire 5-year life span of the model. Also, the RMS errors at the Earth's surface horizontal intensity (H), the vertical component (Z), and the total intensity (F) of WMM are estimated to be well below 200 nT over the entire 5-year life of the model. Thus, the WMM meets and exceeds the accuracy requirements detailed in MIL-W-89500 (Defense Mapping Agency, 1993) for the entire life span of the model.

## **4 Maintenance**

Regular maintenance is important to ensure continued proper operation of the Maretron GPS200. Perform the following tasks periodically:

- Clean the unit with a soft cloth. Do not use chemical cleaners as they may remove paint or markings or may corrode the GPS200 enclosure or seals. Do not use any cleaners containing acetone, as they will deteriorate the plastic enclosure.
- Ensure that the unit is mounted securely and cannot be moved relative to the mounting surface. If the unit is loose, tighten the mounting screws.
- Check the security of the cable connected to the NMEA 2000® interface and tighten if necessary.

## 5 Troubleshooting

If you notice unexpected operation of the Maretron GPS200, follow the troubleshooting procedures in this section to remedy simple problems.

Symptom	Troubleshooting Procedure
No data output	<p>Check the connections to the NMEA 2000<sup>®</sup> connector and tighten if necessary</p> <p>Ensure that power is supplied to the connected NMEA 2000<sup>®</sup> cable</p> <p>Ensure that the GPS200 has a clear view to the horizon in all directions</p> <p>Ensure that no VHF, satellite, or radar antennas have been mounted near the GPS200</p>

*Warning: There are no user-serviceable components inside the Maretron GPS200. Opening the GPS200 will expose the sensitive electronic components to adverse environmental conditions that may render the unit inoperative. Please do not open the GPS200, as this will automatically void the warranty. If service is required, please return the unit to an authorized Maretron service location.*

## 6 Technical Specifications

### Specifications

Parameter	Value	Comment
Position Accuracy (Autonomous)	<3m	2D RMS (95% of Data Falls Within 10m)
Position Accuracy (WAAS)	<2.5m	2D RMS (95% of Data Falls Within 3m)
Channels	32	Simultaneous Tracking of 32 Satellites
Tracking Sensitivity	-159dBm	
Position Update Rate	5 per Second	5 Hz Position Fix Calculation Rate
Speed Update Rate	4 per Second	
Time Update Rate	1 per Second	
Hot Start	1 Seconds	Start Within Hours of Last Power Down
Warm Start	33 Seconds	Start Within Days of Last Power Down
Cold Start	36 Seconds	Start from Unknown Position
Satellite Based Augmentation System	WAAS	North America
	EGNOS	Europe
	MSAS	Asia
Acceleration Limit	<4g	
Altitude Limit	<18000 m	
Velocity Limit	<515 m/sec	
Jerk Limit	20 m/sec <sup>3</sup>	
Battery Backup	Lithium (4-5 Days)	Holds Position for Hot/Warm Starts

## Electrical

Parameter	Value	Comment
Operating Voltage	9 to 16 Volts	DC Voltage
Power Consumption	<100mA	Average Current Drain
Load Equivalence Number (LEN)	2	NMEA 2000 <sup>®</sup> Spec. (1LEN = 50 mA)
Reverse Battery Protection	Yes	Indefinitely
Load Dump Protection	Yes	Energy Rated per SAE J1113

## Mechanical

Parameter	Value	Comment
Size	4" Diameter x 1.65" Tall	Not Including Antenna Mount Base
Weight	6 oz.	Not Including Antenna Mount Base
Mounting	Deck or Pole	

## Environmental

Parameter	Value
IEC 60954 Classification	Exposed
Degree of Protection	IP67
Operating Temperature	-25°C to 55°C
Storage Temperature	-40°C to 70°C
Relative Humidity	93%RH @40° per IEC60945-8.2
Vibration	2-13.2Hz @ ±1mm, 13.2-100Hz @ 7m/s <sup>2</sup> per IEC 60945-8.7
Rain and Spray	12.5mm Nozzle @ 100liters/min from 3m for 30min per IEC 60945-8.8
Solar Radiation	Ultraviolet B, A, Visible, and Infrared per IEC 60945-8.10
Corrosion (Salt Mist)	4 times 7days @ 40°C, 95%RH after 2 hour Salt Spray Per IEC 60945-8.12
Electromagnet Emission	Conducted and Radiated Emission per IEC 60945-9
Electromagnetic Immunity	Conducted, Radiated, Supply, and ESD per IEC 60945-10
Safety Precautions	Dangerous Voltage, Electromagnetic Radio Frequency per IEC 60945-12

## Installation Template

Please check the dimensions before using the following diagram as a template for drilling the mounting holes; the printing process may have distorted the dimensions.

**Figure 5 – Horizontal Mounting Surface Template**

## Appendix A – NMEA 2000® Interfacing

### GPS200 NMEA 2000® Periodic Data Transmitted PGNs

#### ***PGN 126992 – System Time***

The GPS200 uses this PGN to provide a regular transmission of UTC time and date and to provide synchronism for measurement data. The factory default for periodic transmission rate is once per second. The transmission of this PGN can be disabled or the transmission rate of this PGN can be changed (see PGN 126208 – NMEA Request Group Function – Transmission Periodic Rate).

- Field 1: SID – The sequence identifier field is used to tie related PGNs together. For example, the GPS200 will transmit identical SIDs for 126992 (System Time), 128259 (Speed), 129026 (COG and SOG, Rapid Update), 129029 (GNSS Position Data), 129539 (GNSS DOPs), and 129540 (GNSS Satellites in View) to indicate that the readings are linked together (i.e., the data from each PGN was taken at the same time although they are reported at slightly different times).
- 2: Source – This field is used to indicate the type of time source, therefore this field always reads as 0 (GPS).
  - 3: Reserved (4 bits) – This field is reserved by NMEA; therefore, this field always contains a value of 0xF (the GPS200 sets all reserved bits to a logic 1)
  - 4: Date – This field is used to indicate the UTC Date in resolution of 1 day (the number of days since January 1, 1970).
  - 5: Time – This field is used to indicate the UTC Time in resolution of  $1 \times 10^{-4}$  s (24 hour clock, 0.0000 = midnight).

#### ***PGN 127258 – Magnetic Variation***

The GPS200 uses this PGN to provide a regular transmission of magnetic variation. The factory default for periodic transmission rate is once per second. The transmission of this PGN can be disabled or the transmission rate of this PGN can be changed (see PGN 126208 – NMEA Request Group Function – Transmission Periodic Rate).

- Field 1: SID – The sequence identifier field is used to tie related PGNs together. For example, the GPS200 will transmit identical SIDs for 126992 (System Time), 128259 (Speed), 129026 (COG and SOG, Rapid Update), 129029 (GNSS Position Data), 129539 (GNSS DOPs), and 129540 (GNSS Satellites in View) to indicate that the readings are linked together (i.e., the data from each PGN was taken at the same time although they are reported at slightly different times).
- 2: Variation Source – The GPS200 uses the WMM2005 for variation, therefore this field always reads as 5 (WMM2005).
  - 3: Reserved (4 bits) – This field is reserved by NMEA; therefore, this field always contains a value of 0xF (the GPS200 sets all reserved bits to a logic 1)
  - 4: Age of Service (Date) – This field is used to indicate the UTC Date in resolution of 1 day (the number of days since January 1, 1970).
  - 5: Variation – This field is used to indicate the magnetic variation where positive values represent Easterly and negative values represent Westerly variation.

#### ***PGN 129025 – Position, Rapid Update***

## ***GPS200 User's Manual***

---

The GPS200 uses this PGN to provide latitude and longitude referenced to WGS84. The factory default for periodic transmission rate is 10 times per second. The transmission of this PGN can be disabled or the transmission rate of this PGN can be changed (see PGN 126208 – NMEA Request Group Function – Transmission Periodic Rate).

- Field 1: Latitude – Latitude in  $1 \times 10^{-7}$  degrees ("-" = south, "+" = north)  
2: Longitude – Longitude in  $1 \times 10^{-7}$  degrees ("-" = west, "+" = east)

### ***PGN 129026 – COG and SOG, Rapid Update***

The GPS200 uses this PGN to provide Course Over Ground (COG) and Speed Over Ground (SOG). The factory default for periodic transmission rate is four times per second. The transmission of this PGN can be disabled or the transmission rate of this PGN can be changed (see PGN 126208 – NMEA Request Group Function – Transmission Periodic Rate).

- Field 1: SID – The sequence identifier field is used to tie related PGNs together. For example, the GPS200 will transmit identical SIDs for 126992 (System Time), 128259 (Speed), 129026 (COG and SOG, Rapid Update), 129029 (GNSS Position Data), 129539 (GNSS DOPs), and 129540 (GNSS Satellites in View) to indicate that the readings are linked together (i.e., the data from each PGN was taken at the same time although they are reported at slightly different times).
- 2: COG Reference – This field is used to indicate the direction reference of the course over ground. This field always reads as 0 (True, not magnetic).
- 3: Reserved (6 bits) – This field is reserved by NMEA; therefore, this field always contains a value of 0x3F (the GPS200 sets all reserved bits to a logic 1)
- 4: Course Over Ground – This field is used to indicate the course over ground (COG) in resolution of  $1 \times 10^{-4}$  radians.
- 5: Speed Over Ground – This field is used to indicate the speed over ground (SOG) in resolution of  $1 \times 10^{-2}$  m/s.
- 6: Reserved (16 bits) – This field is reserved by NMEA; therefore, this field always contains a value of 0xFFFF (the GPS200 sets all reserved bits to a logic 1)

### ***PGN 129029 – GNSS Position Data***

The GPS200 uses this PGN to convey a comprehensive set of Global Navigation Satellite System (GNSS) parameters, including position information. The factory default for periodic transmission rate is once per second. The transmission of this PGN can be disabled or the transmission rate of this PGN can be changed (see PGN 126208 – NMEA Request Group Function – Transmission Periodic Rate).

- Field 1: SID – The sequence identifier field is used to tie related PGNs together. For example, the GPS200 will transmit identical SIDs for 126992 (System Time), 128259 (Speed), 129026 (COG and SOG, Rapid Update), 129029 (GNSS Position Data), 129539 (GNSS DOPs), and 129540 (GNSS Satellites in View) to indicate that the readings are linked together (i.e., the data from each PGN was taken at the same time although they are reported at slightly different times).
- 2: Position date – UTC Date in resolution of 1 day (The number of days since January 1, 1970).
- 3: Position time – UTC Time in resolution of  $1 \times 10^{-4}$  s (24 hour clock, 0.0000 = midnight).

- 4: Latitude – Latitude in  $1 \times 10^{-16}$  degrees ("-" = south, "+" = north)
- 5: Longitude – Longitude in  $1 \times 10^{-16}$  degrees ("-" = west, "+" = east)
- 6: Altitude – Altitude referenced to WGS-84 in (resolution of  $1 \times 10^{-6}$  m)
- 7: Type of System – This field is used to indicate type of GPS system. The GPS200 will show either 0 (GPS) or 3 (GPS+SBAS, factory default) dependent on whether the user has enabled SBAS.
- 8: Method, GNSS – This field is used to indicate the quality of GNSS information. The GPS200 indicates one of the following values: 0=no GPS, 1=GNSS fix, 2=DGNSS fix, 6=Estimated (dead reckoning).
- 9: Integrity – This field always contains a value of 0 (no integrity checking).
- 10: Reserved (6 bits) – This field is reserved by NMEA; therefore, this field always contains a value of 0x3F (the GPS200 sets all reserved bits to a logic 1)
- 11: Number of SVs – This field is used to indicate the number of satellites used in solution.
- 12: HDOP – This field is used to indicate the horizontal dilution of precision with a resolution of  $1 \times 10^{-2}$  (unitless).
- 13: PDOP – This field is used to indicate the positional dilution of precision with a resolution of  $1 \times 10^{-2}$  (unitless).
- 14: Geoidal Separation – This field is used to indicate the Geoidal Separation in resolution of  $1 \times 10^{-2}$  m.
- 15: Number of Reference Stations – This field always contains a value of 0
- 16: Reference Station Type "1" – This field always contains a value of 0xF (Null)
- 17: Reference Station ID "1" – This field always contains a value of 0xFFFF (data not available)
- 18: Age of DGNSS Corrections "1" – This field always contains a value of 0xFFFF (data not available)

### **PGN 129539 – GNSS DOPs**

The GPS200 uses this PGN to provide a single transmission containing GNSS status and dilution of precision components (DOP) that indicate the contribution of satellite geometry to the overall positioning error. There are three DOP parameters reported, horizontal (HDOP), Vertical (VDOP) and time (TDOP). The factory default for periodic transmission rate is once per second. The transmission of this PGN can be disabled or the transmission rate of this PGN can be changed (see PGN 126208 – NMEA Request Group Function – Transmission Periodic Rate).

- Field 1: SID – The sequence identifier field is used to tie related PGNs together. For example, the GPS200 will transmit identical SIDs for 126992 (System Time), 128259 (Speed), 129026 (COG and SOG, Rapid Update), 129029 (GNSS Position Data), 129539 (GNSS DOPs), and 129540 (GNSS Satellites in View) to indicate that the readings are linked together (i.e., the data from each PGN was taken at the same time although they are reported at slightly different times).
- 2: Set Mode – This field is used to indicate the desired mode of operation: 0 = 1D, 1 = 2D, 2 = 3D, 3 = Auto (factory default), 4-5 = Reserved, 6 = Error, 7 = Null. The GPS200 will always return a value of 3 for this parameter.
- 3: Op Mode – This field is used to indicate the actual current mode of operation: 0 = 1D, 1 = 2D, 2 = 3D, 3 = Auto (factory default), 4-5 = Reserved, 6 = Error, 7 = Null.

- 4: Reserved (2 bits) – This field is reserved by NMEA; therefore, this field always contains a value of 0x3 (the GPS200 sets all reserved bits to a logic 1)
- 5: HDOP – This field is used to indicate the horizontal dilution of precision with a resolution of  $1 \times 10^{-2}$  (unitless).
- 6: VDOP – This field is used to indicate the vertical dilution of precision with a resolution of  $1 \times 10^{-2}$  (unitless).
- 7: TDOP – This field is used to indicate the time dilution of precision with a resolution of  $1 \times 10^{-2}$  (unitless).

### ***PGN 129540 – GNSS Satellites in View***

The GPS200 uses this PGN to provide the GNSS information on current satellites in view tagged by sequence ID. Information includes PRN, elevation, azimuth, and SNR. Field 4 defines the number of satellites. Fields 5 through 11 defines the satellite number and the information. Fields 5 through 11 are sequentially repeated for each satellite to be transmitted. The factory default for periodic transmission rate is once per second. The transmission of this PGN can be disabled or the transmission rate of this PGN can be changed (see PGN 126208 – NMEA Request Group Function – Transmission Periodic Rate).

- Field 1: SID – The sequence identifier field is used to tie related PGNs together. For example, the GPS200 will transmit identical SIDs for 126992 (System Time), 128259 (Speed), 129026 (COG and SOG, Rapid Update), 129029 (GNSS Position Data), 129539 (GNSS DOPs), and 129540 (GNSS Satellites in View) to indicate that the readings are linked together (i.e., the data from each PGN was taken at the same time although they are reported at slightly different times).
- 2: Mode – This field always reads as 3 (Null), indicating that range residuals are used to calculate position, and not calculated after the position.
  - 3: Reserved (6 bits) – This field is reserved by NMEA; therefore, this field always contains a value of 0x3F (the GPS200 sets all bits to a logic 1)
  - 4: Number of SVs – This field is used to indicate the number of current satellites in view. Fields 5-11 are repeated the number of times specified by this field's value.
  - 5: PRN "1" – This field is used to indicate the Satellite ID Number of the satellite (1-32=GPS, 33-64=SBAS, 65-96=GLONASS).
  - 6: Elevation "1" – This field is used to indicate the Elevation of the satellite.
  - 7: Azimuth "1" – This field is used to indicate the Azimuth of the satellite.
  - 8: SNR "1" – This field is used to indicate the Signal to Noise Ratio (SNR) of the satellite.
  - 9: Range Residuals "1" – The GPS200 always sets this field to a value of 0x7FFFFFFF (data not available)
  - 10: PRN Status "1" – This field is used to indicate the status of the first satellite in the list. (0=Not Tracked, 1=Tracked but not used in solution, 2=Used in solution without Differential corrections, 3=Differential Corrections available, 4=Tracked with Differential Corrections, 5=used with Differential Corrections)
  - 11: Reserved (4 bits) – This field is reserved by NMEA; therefore, this field always contains a value of 0xF (the GPS200 sets all bits to a logic 1)

If Field 4 contains a value greater than one, then the group of fields 5 through 11 is repeated until this group appears the number of times indicated by the value of Field 4.

## **GPS200 NMEA 2000® Non-Periodic Data Transmitted PGNs**

### ***PGN 129538 – GNSS Control Status***

The GPS200 uses this PGN to provide the GNSS common satellite receiver parameter status. GPS200 sends this PGN only when requested by PGN 059904 (ISO Request).

- Field 1: SV Elevation Mask – If the elevation of a satellite (angle above the horizon) is below this value, the GPS200 will not use that satellite in the solution. Units are  $1 \times 10^{-4}$  radians. The GPS200 always indicates “data not available” for this field, indicating that this parameter is not user configurable.
- 2: PDOP Mask – If the PDOP exceeds this value, the GPS200 will indicate “No GNSS fix” or “Dead Reckoning Mode” in PGN 129029. Units are  $1 \times 10^{-2}$  (unitless). The GPS200 always indicates “data not available” for this field, indicating that this parameter is not user configurable.
- 3: PDOP Switch – If the PDOP exceeds this value, a GPS receiver will switch from 3D to 2D mode. For the GPS200, this field always contains a value of 0x7FFF, indicating that the GPS200 will always attempt to operate in 3D mode. Units are  $1 \times 10^{-2}$  (unitless). The GPS200 always indicates “data not available” for this field, indicating that this parameter is not user configurable.
- 4: SNR Mask – If the SNR of a satellite is below this value, the GPS200 will not use that satellite in the solution. Units are  $1 \times 10^{-2}$  dB. The factory default is to use all available satellites. The GPS200 always indicates “data not available” for this field, indicating that this parameter is not user configurable.
- 5: GNSS Mode – This field is used to indicate the desired mode of operation: 0 = 1D, 1 = 2D, 2 = 3D, 3 = Auto (factory default), 4-5 = Reserved, 6 = Error, 7 = Null. The GPS200 always returns a value of 3 (Auto) for this parameter, which is not user configurable).
- 6: DGNSS Mode – This field is used to indicate the desired mode of operation of DGNSS (0=do not use SBAS, 1 and 3=Use SBAS when available). The factory default value for this field is 1 (use SBAS when available).
- 7: Position / Velocity Filter – This field always contains a value of 0x3, indicating that the GPS200 does not allow configuration of the position / velocity filter.
- 8: Max Correction Age – This field always contains a value of 0xFFFF, indicating that the GPS200 does not allow configuration of the maximum age of SBAS correction data to be used.
- 9: Antenna Altitude for 2D Mode – This field is used to indicate the antenna altitude for the GPS200 to use when operating in 2D mode in units of  $1 \times 10^{-2}$  m. The factory default for this field is 0.0 m, and is not user configurable.
- 10: Use Antenna Altitude for 2D Mode – This field is used to indicate whether the GPS200 will use Antenna Altitude (Field 9) when operating in 2D mode. The GPS200 returns a value of 1 for this parameter, indicating that it will always indicate an Antenna Altitude of 0.0m when operating in 2D mode. This field is not user programmable.

## **GPS200 NMEA 2000® Received PGNs**

### ***PGN 126208 – NMEA Command Group Function – GNSS Control Status***

## ***GPS200 User's Manual***

---

This will change the configuration of the GPS200.

- Field 1: Complex Command Group Function Code (8 bits) – set this field's value to 0x01, which denotes a command PGN.
- 2: Commanded PGN (24 bits) – set this field's value to 129538, which denotes the GNSS Control Status PGN.
- 3: Priority Setting (4 bits) – set this field's value to 0x8, which indicates to leave priority settings unchanged.
- 4: Reserved (4 bits) – set this field's value to 0xF, which is the value for a reserved field of this size.
- 5: Number of Pairs of Commanded Parameters to Follow (8 bits) – set this field's value to the number of configurations to be changed.
- 6: Field number of first commanded parameter (8 bits). Please refer to the table below for valid values for this field.
- 7: Value of first command parameter (size depends on the field number specified in field 6 of this PGN) – please refer to the description of PGN 129538 above for details.

Field Number of Commanded Parameter	Name of Commanded Parameter	Size (Bytes)
5	GNSS Mode	1
6	DGNSS Mode	1

Fields 6 and 7 are repeated pair wise until all parameters to be modified have been specified.

### ***PGN 126208 – NMEA Command Group Function – Maretron Proprietary Restart GPS Engine***

This will force the GPS200 to restart its GPS engine without performing a full reset of the unit.

- Field 1: Complex Command Group Function Code (8 bits) – set this field's value to 0x01, which denotes a command PGN
- 2: Commanded PGN (24 bits) – set this field's value to 126720, which denotes the Maretron proprietary PGN
- 3: Priority Setting (4 bits) – set this field's value to 0x8, which indicates to leave priority settings unchanged
- 4: Reserved (4 bits) – set this field's value to 0xF, which is the value for a reserved field of this size
- 5: Number of Pairs of Commanded Parameters to Follow (8 bits) – set this field's value to 0x4, indicating that four parameters will follow
- 6: Number of First Commanded Parameter (8 bits) – set this field's value to 0x1
- 7: Maretron Vendor ID and Industry Code (16 bits) – set this field's value to 0x9889
- 8: Number of Second Commanded Parameter (8 bits) – set this field's value to 0x02
- 9: Product Code (16 bits) – set this field's value to 0x6F0, which is the NMEA 2000<sup>®</sup> product code for the GPS200.
- 10: Number of Third Commanded Parameter (8 bits) – set this field's value to 0x03

- 11: Software Code (16 bits) – set this field's value to 0x0001, which is the identifier for this version of the Maretron proprietary protocol
- 12: Maretron Command (8 bits) – set this field's value to 0x30, which will force the GPS Engine to restart as selected by the following field.
- 13: Restart mode (8 bits) – set this field's value to select the restart mode, 0=Factory restart, 1=Cold start.

### ***PGN 126208 – NMEA Request Group Function – Transmission Periodic Rate***

This PGN will enable or disable the periodic transmission of specific PGNs.

- Field 1: Complex Command Group Function Code (8 bits) – set this field's value to 0x00, which denotes a request PGN
- 2: Requested PGN (24 bits) – set this field's value to the corresponding PGN for which you wish to change the periodic rate.
  - 3: Transmission Interval (32 bits) – set this field's value to 0x0 to disable the periodic transmission of the PGN identified in field 2 above. Set this field's value to 0xFFFFFFFFE to restore periodic transmission of the PGN identified in field 2 at the default rate. Otherwise, program in the desired periodic rate to restore periodic transmission of the PGN identified in field 2 above at the desired rate. The resolution of this field is 1 millisecond.
  - 4: Transmission Interval Offset (16 bits) – set this field's value to 0xFFFF; all other values will cause the request to be rejected.
  - 5: Number of Pairs of Commanded Parameters to Follow (8 bits) – set this field's value to 0x0.
