Symbol used in this Operation Manual

The following pictograms are used in this manual. The meaning of each symbols shall be well understood and the maintenance and inspection shall be carried out.

Symbol	Meaning
 Warning	Mark for warning This mark denotes that there is a risk of death or serious injury when dealt with incorrectly.
	Mark for danger of high voltage This mark denotes that there is a risk of death or serious injury due to electric shock when dealt with incorrectly.
 Caution	Mark for caution This mark denotes that there is a risk of slight injury or damages of devices when dealt with incorrectly.
	Mark for prohibition This mark denotes prohibition of specified conducts. Description of the prohibition is displayed near the mark.

Precautions on equipment

	Be careful of high voltage inside High voltage, which may risk you life, is used. This high voltage may remain in the circuit even after the power is switched off. To prevent contact with the high voltage circuits accidentally, a protective cover or the label with this mark is provided on the high voltage circuit. When the inside is to be checked, ensure to switch off the power and to discharge the residual voltage for safety. An engineer authorized by Koden shall carry out the inspection and maintenance works.
 Warning	Power off in the boat An accidental power-on during works may result in worker's electrification. To prevent such accident in advance, ensure that power in the boat and on the equipment are switched off. Furthermore, it is safer to hang a caution tag saying "Under work" near the power switch of equipment.
 Warning	Be careful of dust Inhaled dust may cause respiratory affection. At the time of cleaning the inside of equipment, be careful not to inhale dust. Wearing a safety mask is recommended.
 Caution	Caution on location of installment The equipment shall not be installed at locations which are excessively damp and suffers from water drops. Otherwise, dew condensation may occur inside the display screen, and corrosion may occur inside the unit box.

 Caution	<p>Measures against static electricity</p> <p>Static electricity may be generated from the carpet on the floor in the cabin or clothes made of synthetic fiber, and it may destroy the electronic components on circuit boards. The circuit boards shall be handled with appropriate measures against static electricity.</p>

Precautions on handling

 Warning	<p>No disassembly or modification of this equipment is allowed. It may lead to failure, firing, smoking or electric shock. In case of failure, please contact Koden's dealers or Koden.</p>
 Warning	<p>In case of smoking or firing, switch off the power in the boat and of this equipment. It may lead to firing, electric shock or damages.</p>
	<p>Be careful of residual high voltage</p> <p>High voltage may remain in capacitors for several minutes after switching off the power. Before inspection of the inside, please wait at least 5 minutes after switching off or discharge the residual electricity in an appropriate manner. Then, start the work.</p>

Introduction

KGP-915 is a GNSS navigator for GPS/GLONASS system.

GPS is a navigation system using 24 satellites (21 plus 3 in service) orbiting 20,183 km high from the earth every 11 hours 58 minutes. And GLONASS is orbiting 19,100 km high from the earth 11 hours 15 minutes.

The main features of this unit are as follows:

- KGP-915 consists of two main components, Display and Antenna. Display unit has processor, receiver and LCD display built-in.
- KGP-915 has high-resolution color LCD of high brightness type.
- KGP-915 can support DGPS by connecting an external beacon receiver.
- Also support DGPS by SBAS (Satellite Based Augmentation System).
- KGP-915 can storage 10,000 waypoints, 100 routes, and 3,000 track points.
- KGP-915 has two data port of NMEA 0183.

4.2 Menu 3: GNSS

4.2.1 Monitoring GNSS satellite signal reception

You can monitor the signal status from GNSS (SBAS) satellites. The signals from 3 satellites are used for two-dimensional positioning, but signals from 4 or more satellites are required for three-dimensional positioning.

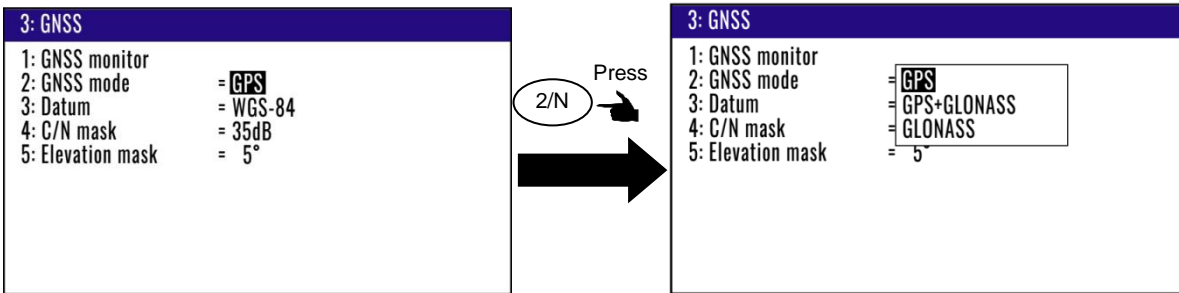

- (1) Press **MENU** key until Menu options 1 to 10 appears.
- (2) Press **3** key to select “**3: GNSS**”.
- (3) Press **1** key to select “**1: GNSS Monitor**”. Reason for alarm notification is displayed

4.2.2 Selecting a GNSS mode

There are the three modes, GPS, GPS+GLONASS, GLONASS. Usually, it is used in GPS mode.

- (1) Press **MENU** key until Menu options 1 to 10 appears.
- (2) Press **3** key to select “**3: GNSS**”.
- (3) Press **2/N** key to select “**2: GNSS mode**”.
- (4) Press [▲] or [▼] key to select desired measuring system mode.
- (5) Press **ENT** key.

Initial setup: GPS

4.2.3 Selecting a geodetic datum

The latitude and longitude are calculated based on the WGS-84 with GNSS system. However, the charts used in many countries are based on different geodetic datum. You can compensate this difference from your chart by converting GNSS position data into your actual chart system. To select a geodetic datum, see "Local Geodetic Systems" (Chapter 9 Annex).

- (1) Press **MENU** key until Menu options 1 to 10 appears.
- (2) Press **3** key to select "**3: GNSS**".

4.2.5 Masking satellite elevation angle

When the satellite is below 5 degrees above the horizon, signal reflection and interference can cause erroneous positioning. You can improve the positioning accuracy by masking the elevation angle. However, a large mask value shortens the signal receive time and most satellite combinations are rejected.

- (1) Press **MENU** key until Menu options 1 to 10 appears.
- (2) Press **3** key to select “**3: GNSS**”.
- (3) Press **5** key to select “**5: Elevation mask**”.

4.3 Menu 4: Differential GNSS(DGNSS)

This DGNSS system can improve the GNSS positioning accuracy. There are three styles, Auto and SBAS and Beacon. "BEACON" requires a signal from the external receiver system which outputs the compensation data of RTCM SC-104. (Example KBG-3 or other brand)

"AUTO" mode is automatically changes SBAS and Beacon which continue DGNSS performance.

4.3.1 Displaying DGNSS

When the DGNSS is set, the DGNSS status is displayed with letters **D** by the top right corner of the screen.

4.4.4 Compensating the compass

The course and bearing to waypoint is shown in true bearing. You can adjust the GNSS true bearing to the magnetic compass bearing.

(Automatic compensation)

In the Auto mode, the magnetic compass is compensated based on the built-in global magnetic variation maps. However, avoid using this mode if you are higher than 75 degrees North or South latitude. The compass may have a small error because the system contains world maps. Manual correction is recommended. For areas that do not allow exact translation of a true bearing to a magnetic bearing, despite the map covering the whole world, the resulting value may differ from the actual deviation.

4.6.1 Setting average constants(measuring position, speed and course)

Use the averaging function to compare GNSS sensor signals several times and get their average. This stabilizes the GNSS position (latitude and longitude), speed and course data. The maximum averaging rate is “4” and the minimum averaging rate is “0”. When you select “4” value, data is averaged more often and the display data has smaller variations. However, delays for updating occur. When you select a “0” value, data is averaged less but the display data responds quicker. Selecting a constant (averaging constant) suitable for your boat speed will provide you with smoother data of the boat position, course and speed.

Carefully check the exterior of each component unit for dents, damage, etc. Also check the inside of component units for electrical and mechanical damages.

7.3 Siting the units

To achieve best operational performance, the following factors must be considered.

- (1) The Display unit should be positioned in the location where the external situation can be viewed.
- (2) Locate the display so that it provides easy viewing from all likely operator's positions.
- (3) Select a position safe and free from dampness, water spray, rain and direct sunlight.
- (4) Provide enough space for servicing. Consider access to the rear panel for connecting cables.
- (5) Position the Display unit as possible away from other radio equipment.

7.4 Display unit installation

The Display unit is designed for table mount and flush mount. Refer to Figure 7.1, 7.2 or 7.3 for installation.

7.4.1 Table mounting

- (1) Remove the two knurled fixing knobs that fix the Display unit to the mounting bracket.
- (2) Remove the Display unit from the bracket and place it on a flat and safe area.
- (3) Place the mounting bracket to the place where the Display unit is to be installed, and fix the bracket with four tapping screws.

7.5 Antenna unit installation

7.5.1 Selecting the best site of GNSS / Beacon antenna

Make sure to install the Antenna unit at a location where nothing shades the antenna of a view above the horizon. Objects placed above the Antenna unit or too close to the Antenna unit may cause signal to noise ratio to degrade and shorten measuring time.

- (1) As far away from any metallic objects as possible.
- (2) At least 4 meters (13.2 feet) away from the MF/HF reversed L-type TX antenna, VHF or HF whip antenna.
- (3) At least 1.5 meter (4.9 feet) above the MF/HF reversed L-type TX antenna.
- (4) At least 1 meter (3.3 feet) away from the receiving antenna.
- (5) Outside radar transmitting beam (30° to 40°).
- (6) At least 1 meter (3.3 feet) away from the radar antenna.
- (7) At least 5 meters (16.5 feet) away from the Inmarsat antenna.
- (8) At least 3 meters (9.8 feet) away from the loop antenna.
- (9) At least 2 meters (6.6 feet) away from the ship's engine.
- (10) At least 0.5 meters (1.6 feet) above the large metal surface.

* AT least 0.5 m (1.6 ft) above the large metal surface

Figure 7.4 Recommended GPS / Beacon Antenna installation

7.5.2 Fixing the GNSS Antenna unit

Installation precautions

- (1) Adhesive plastic sealant or silicone for plastic is recommended for fixing screws.

CAUTION

*Use of other solvent or anaerobic based-bond may cause cracking
Of the chassis*

- (2) Stroke of screw insertion should be up to 25mm.

CAUTION

Overtightening of the screw may cause cracking of the chassis

7.5.3 Extension of an antenna cable

Although the standard length of an antenna cable is 10m or 15m, extension of 30m or 60m is possible by the antenna and extension cable of an option.

● Waterproofing on the connector jointing section

- (1) Wind the self-fusible tape around the jointing section.

Pull the tape end to stretch its length to be doubled and wind it overlaid by half to 3 plies. When winding is completed, apply gentle pressure over the surface with fingers to expedite the fusion.

- (2) Apply windings of PVC tape to reinforce the protection.

PVC tape should not be strained. Wind it overlaid by half to 3 plies. When finished, press the surface evenly without strain for complete adhesion of the tape.
