1* Based on DuPont Kevlar® data

2* Based on Allied-Signal Spectra® data-Type 900

3* Resistance is relative to the length of exposure, percent of concentration and temperature.

CAUTION:

USE OF WORKING LOADS

Because of the wide range of rope use, rope condition, and exposure to the various factors affecting the rope, it is impossible to make blanket recommendations as to the correct choice of rope to use. However, we have provided the tensile strength for each diameter and type of rope. These strengths are based on tests of new and unused rope, with appropriate splices. Proper choice, care and inspection of the rope are essential for reasonably safe use of the rope. Consult your cordage vendor for proper use.

DYNAMIC LOADING VOIDS NORMAL WORKS LOADS

Dynamic Loading occurs when rope is subjected to sudden or extreme stress. Figures given as working loads are void if rope has been subjected to dynamic loading, high temperatures, long periods of load, extreme stress, improper use or storage.

EFFECT OF TEMPERATURE ON TENSILE STRENGTH

The tensile strength charts apply to ropes tested at normal room temperature (70°F). Ropes have lower tensile strength at higher temperatures. Continued exposure at elevated temperatures causes permanent damage.

WARNING. MISUSE OF ROPES COULD RESULT IN SERIOUS INJURY.

UNICORD

The Unicord Companies

RATERA BRAIDING SYSTEMS

For over 25 years, Unicord has provided high quality double braided ropes from 1/4" x 1 - 5/16"*.

We can now supply your needs for double braided rope with diameters up to 3" x 600'

We will splice eyes of any size with protective chaffing gears (using Dupont CORDORA®).

Whether you require nylon or polyester, we will produce to your specifications at our facilities in the Chicago area.

This means reduced lead times, lower shipping costs, and a faster turn around for commercial fishing, ships and other cordage requirements.

*We also provide twisted ropes up to 4" in diameter.

8 strand plated up to 8" in diameter in addition to solid braids, diamond braids and bungee cords.

UNICORD

ROPE—OUR OLDEST TOOL

When ancient man used a vine to pull or tie something, he was using a tool. Long before the use of a lever or other hand tools, man used a form of rope. The Phoenicians are said to have hand twisted the ropes they used on their ships, long before the coming of Christ. The process of twisting ropes did not change much for hundreds of years until the early 1800's when machines were used to twist vegetable fibers into 3 and 4 strand ropes. Today, synthetic fibers have become the material of choice for most rope construction. Even now, these fibers are slowly being replaced by "exotic" fibers that

are stronger and more economical than some other rope fibers, even steel. There are two predominant constructions for making rope; twisted and braided. Twisted rope is made from

both vegetable and synthetic fibers. Vegetable fibers most commonly used are manila, cotton and sisal. Synthetic fibers are nylon, polyester (dacron), polypropylene and some combinations of polyester and polypropylene. The basic manufacturing process is done in three or four stages. Most polypropylene is made in three stages. Nylon and polyester and combinations are made in four stages.

1. The individual threads are twisted together to form a yarn.
2. Three yarns are then twisted together.
3. Any number of yarns (dependent on diameter) are twisted to form a strand.
4. Three strands are twisted to form a rope.

Formulas are used to determine what size or diameter of rope is made. Much care is taken to insure that the proper number of threads is used. Each stage of manufacture is done in a different direction

S-(left) Z- (right). This gives the rope the ability to stay together and remain stable. The process of braiding is somewhat the same as for twisting. However, there are more types of construction, such as diamond braid, solid

braid, hollow braid and braid on braid. Each of these types has its own particular construction. Diamond braids generally have a non-braided core. Solid braid has no core. Hollow braid has no core, only a jacket. Braid on braid has a braided core. Cotton is the prime vegetable fiber used in braids. Mainly, synthetics such as nylon, polyester and polypropylene are used. Other synthetics are sometimes used. Braiding begins much like twisting. The yarn is prepared by twisting. The braiding process can be done on machines using eight, twelve or sixteen or thirty two carriers (yarns). The machines braid the yarns together by a zig zag process with yarns coming together to form a rope. When choosing a rope for a particular use, there are some significant factors to consider.

1. Cost - this factor must be determined by the others involved. Cheapest is not always best, nor is high price the final answer.
2. Strength - probably the most significant of all. Remember, the safe working load of any rope is ten percent of the breakstrength.

3. Material - stretch, strength, durability and chemical resistance all make up the choice of a proper material. Sound difficult? Not really; most rope has distinctive quality of its own and it is not too difficult to determine which rope is best for your need. A consultation with your rope vendor generally will result in a wise choice.
